

ABSTRACT

The present invention provides a paperless billing process for enabling expedited and simplified payments of print volume bills by customers of printing systems. A method of performing a billing process for the copies or prints produced by customer
5 of a printing system is provided where the printing system comprises a memory that stores product usage data indicating a measurement of the actual use of the printing system. The printing system first accesses the memory to retrieve the product usage data. Then, the printing system calculates billing data using the retrieved product usage data. A bill is presented to the customer based on billing data, and the printing
10 system receives user input from the customer indicating whether the customer authorizes the billing data. If so, a message is sent from the printing system to a billing service, wherein the message includes information indicating the authorized billing data. Thus, the bills are generated locally by the printing system using the printer user interface.
